

Event Builder + Level 3 for ACEs

Pasha Murat

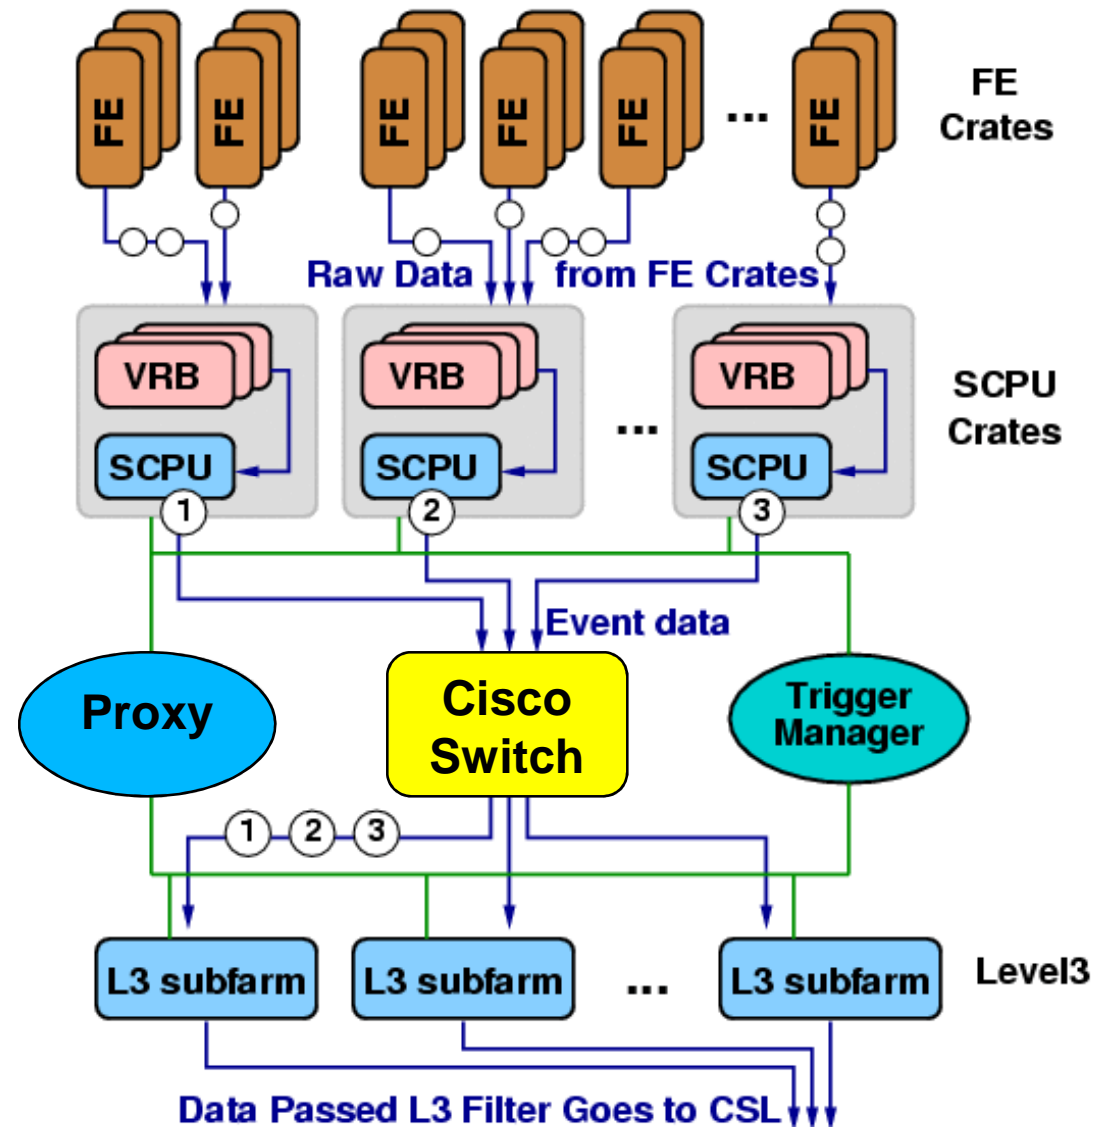

Frank Chlebana

Outline

- Introduction to the Hardware Event Builder
- Introduction to Level 3 Trigger Hardware
- Level 3 Display
- EVB/L3 ACE Control Panel
- Trouble-shooting guide
- Our helpful web-page
- The EVB/Level 3 Team
- Tour of the hardware

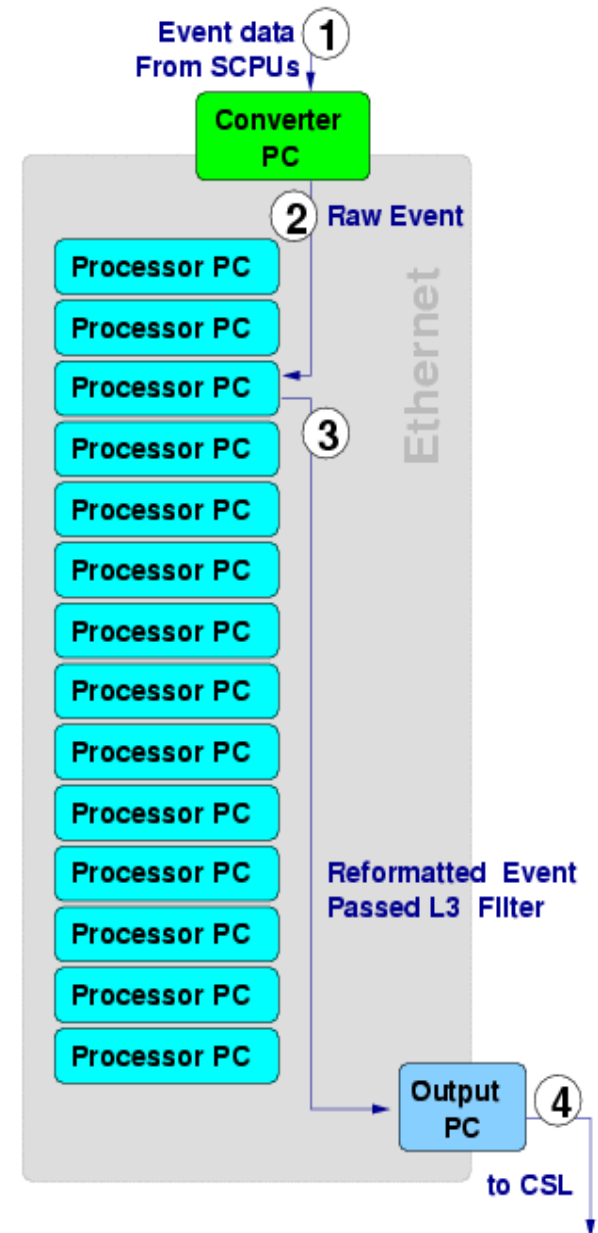

The Event Builder

- When a L2 trigger accept is issued, the Front End (FE) crates write event fragments to VME Readout Buffers (VRB)
- 22 EVB Scanner CPUs (SCPU), transfer fragments belonging to the same event to the Level 3 Filter Farm
- EVB Proxy coordinates the data flow and communicates the with RunControl

Level 3 Trigger Hardware

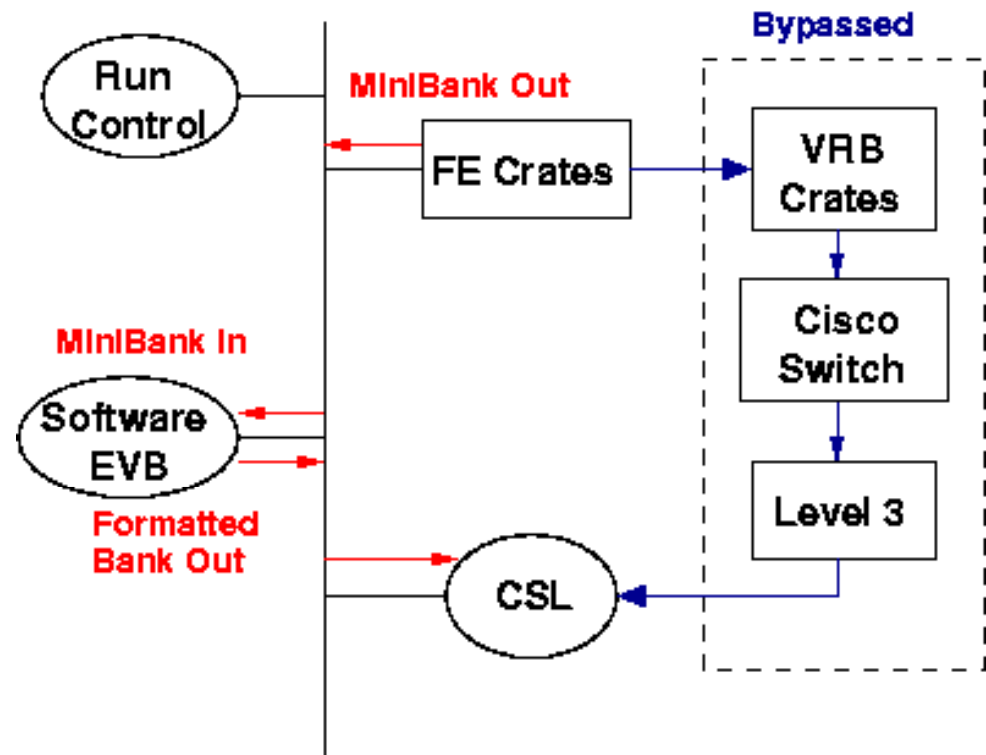

- The *Level 3 filter farm* is arranged into 18 independent sub-farms *~20 nodes each*
- *Converters* receive events from EventBuilder, and distribute to Processor nodes
- *Processors* run Reformatter and Filter code
- Filter does offline-type reconstruction and makes Level 3 trigger decision
- Output nodes collect events that pass, send to Consumer Server Logger (CSL)
- L3Proxy controls farm and communication with RunControl

Topics Not Covered Here

Software Event Builder

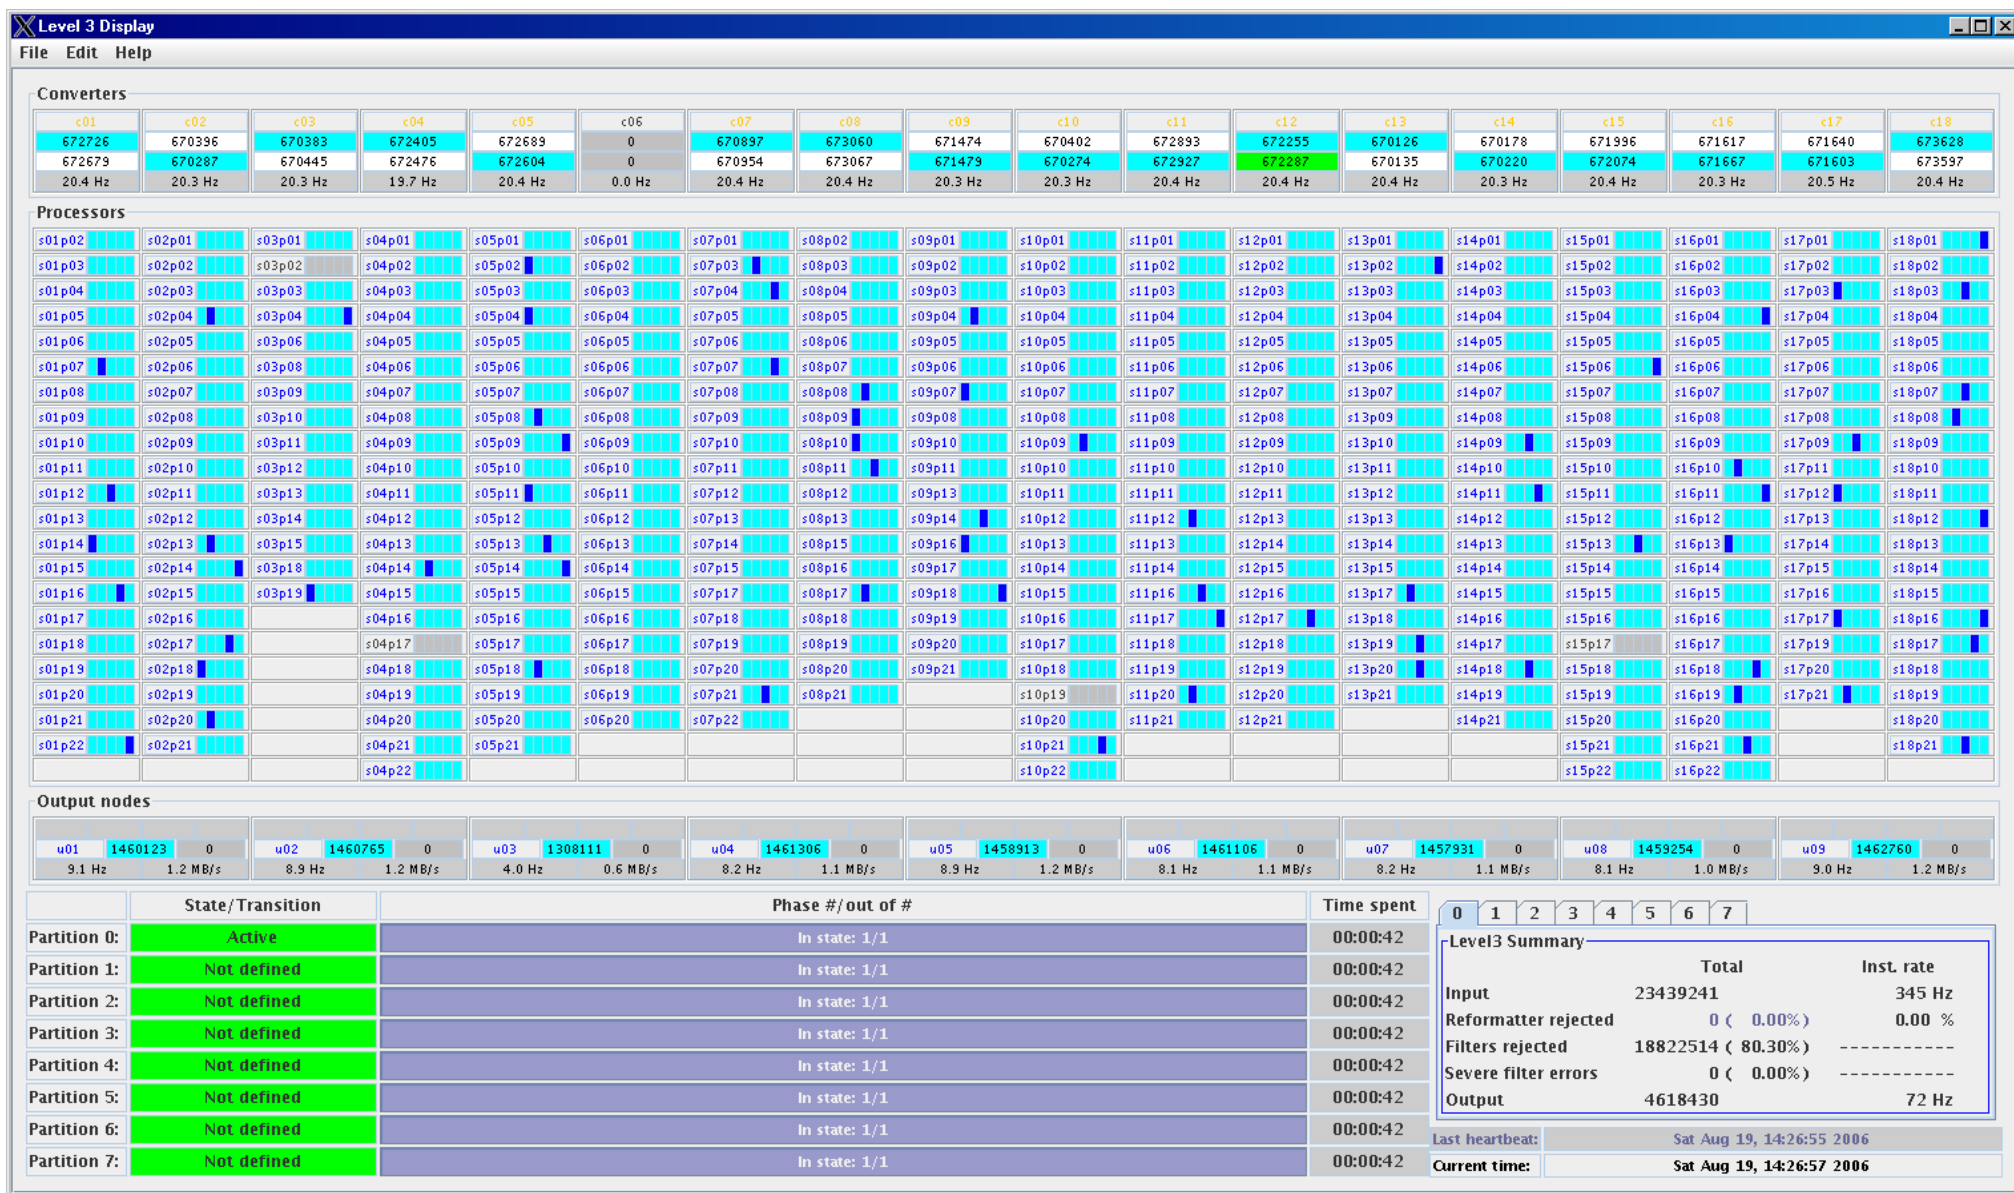

- Bypasses EVB and L3
- Used for calibrations and tests; has limited bandwidth
- Responsibility of DAQ group

Level3 Manager (l3m in RunControl)

- Determines calibration files and executables for L3Filter
- Independent of L3 hardware

The Level 3 Display

Start it from DAQMon

Level3 Display In Action

converter node b013c02

subfarm 11

processor node b013s02p08

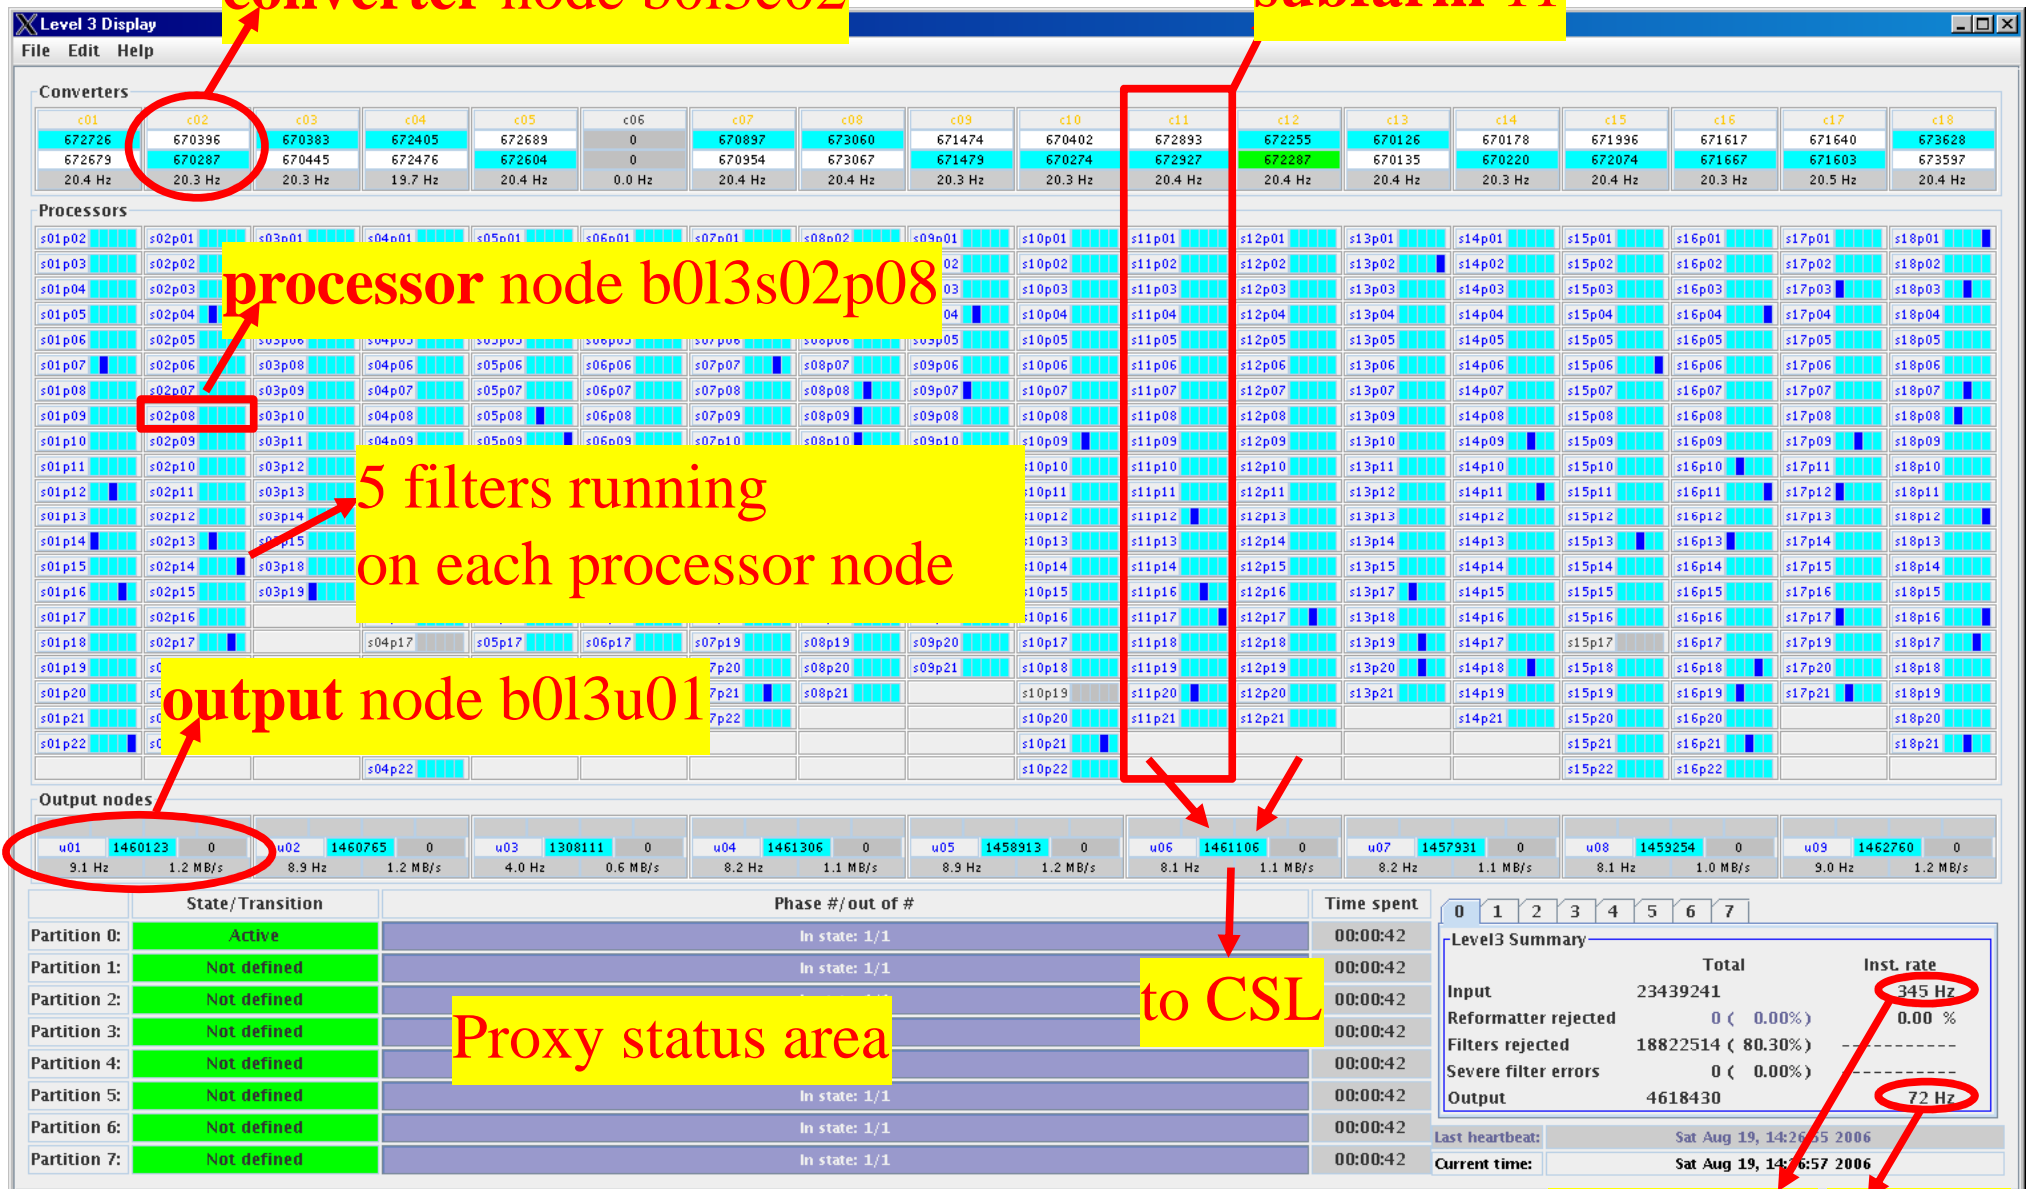

5 filters running
on each processor node

output node b013u01

to CSL

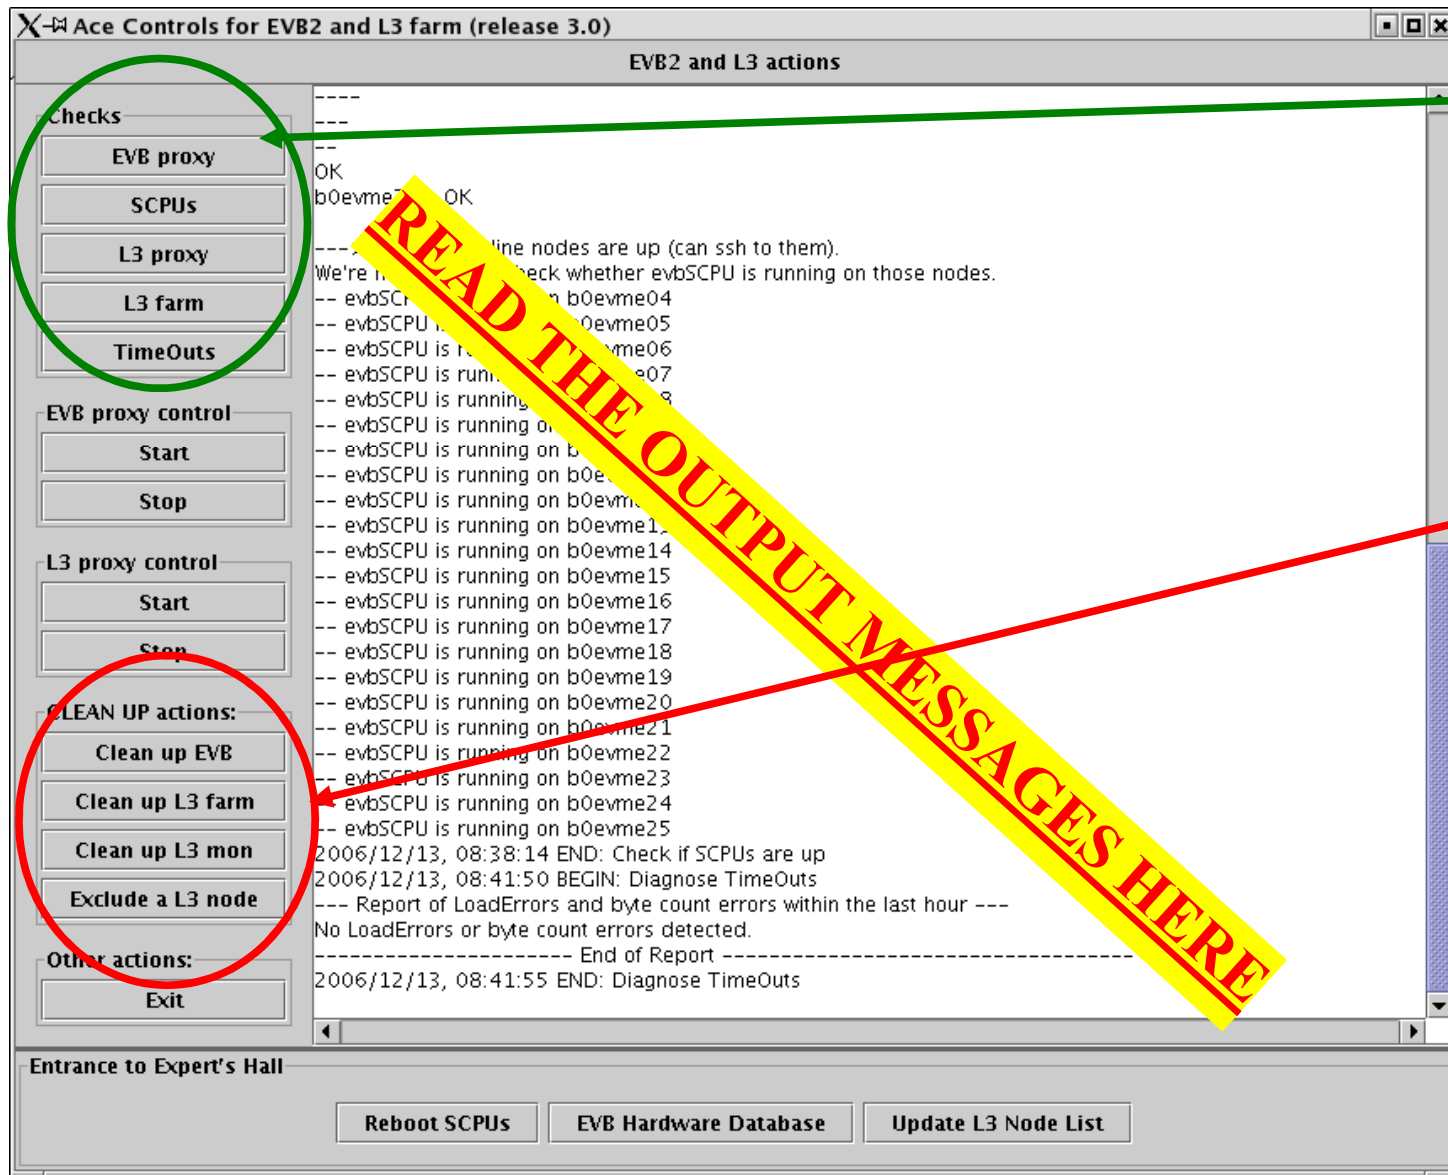

Proxy status area

from EVB to CSL

The EVB/L3 ACE Control Panel

To start: > Evb2Control

- *Checks* are safe
– can do any time

- *Clean-up* can
only be done in
'Start' state

Golden Rules for Smooth Operation

- If in doubt, *page the Expert*
- Always RESET after ENDing or ABORTing a run
- Do not *shepherd* EVB or L3
 - EVB and L3 must be synchronized with other clients
- Read our webpage – we have instructions for common problems that may occur

<http://www-cdfonline.fnal.gov/ops/evbl3shift/evbl3shift.html>

- Contact us if you have questions

Problems You May Encounter

- 'Busy Time-Out' or 'TM2 Events Pending TO'
- EVB fails to respond to a transition
- Level 3 fails a transition
- 'Level3 Relay failure'
- Level3 Reformatter errors
- All these (and more) are covered on our webpage
- If a problem develops with EVB or Level3, please consult the webpage to seek a solution

General Approach to EVB Problems

- Before doing EVB cleanup, always 'check SCPUs' and 'check Proxy'
- Read the output carefully
- If the checks do not indicate a problem, then EVB cleanup *WILL NOT HELP!*
- A pop-up window will ask you for confirmation before cleanup (*sometimes hard to see*)
- Careful: cleanups can fail! Read output and follow with checks again to make sure it worked

The EVB/Level3 ACE Webpage

Hardware Event Builder and Level 3 Farm

RULE 0: All the L3/EVB pages should go to the DAQ group

RULE 1 - If all else fails, go to START, Cleanup L3, Cleanup EVB. Still problems? [Page DAQ](#)

RULE 2 - Go to START before: new run including EVB/L3 or "Cleanup EVB" or "Cleanup L3"
